

NEXUS

Universal Marketing Intelligence Platform

Shopify | Meta Ads | Google Ads | Shiprocket | Claude AI | Manus AI

Client: Ambient Digital

Prepared by: Dcodecafe

Version: 1.0 | March 2026

SECTION 01

Project Overview & Objective

Nexus is a Universal Marketing Intelligence Platform built for Shopify merchants. It brings together data from Meta Ads, Google Ads, Shiprocket, and Shopify into one single dashboard with a UI that feels identical to Shopify — so merchants never feel like they are using a third-party tool.

Core Problem This Platform Solves

Problem	Current Pain	What Nexus Fixes
COD Tracking	Shopify shows "Payment Pending" even after courier collects cash	Real-time COD remittance status pulled from Shiprocket
Delivery Truth	Shopify marks "Fulfilled" at dispatch — not at delivery	Courier-confirmed delivery status shown natively
Attribution Chaos	13–18% of orders claimed by both Meta and Google — ROAS inflated on both	Last Non-Direct Click deduplication — one order, one channel
Zero CAC Data	No link between individual orders and ad spend	Per-order CAC column in the dashboard
No AI Analysis	Merchants manually check each platform separately	Claude + Manus AI chatbot analyses all data together

What Makes This Different From Other Apps

Other Apps	Nexus
Separate tab you have to open	Everything inside Shopify's own dashboard
Different fonts, colors, unfamiliar UI	Same white background, same badge style as Shopify
Merchant switches between 3 screens	Merchant never leaves their Shopify admin
Only solves one problem	COD + Attribution + AI — all in one place
No AI intelligence layer	Claude trained on your data + Manus for Meta accuracy

SECTION 02

Client Requirements

These are the exact requirements gathered from the client — what they want the platform to do, how it should look, and which integrations are non-negotiable.

UI Style	Exactly like Shopify — same colors, same sidebar, same table layout, same fonts. Merchants should feel at home instantly.
Login Page	A clean login page where merchants connect their Shopify store via OAuth. After login, they land directly on the dashboard.
Sidebar Navigation	Left sidebar with: (1) Google Ads, (2) Meta Ads, (3) Shopify Data — in that order. Each page shows data in table format, exactly like Shopify orders page.
Shopify Data Page	Pull all order data from Shopify API. Show in native-style table with extra columns: Acquisition Channel, CAC per order, Delivery Status, Return Status, COD Remitted.
Meta Ads Page	Show all Meta campaign data — spend, ROAS, conversions, CPC. Attribution deduplicated so no order is double-counted.
Google Ads Page	Show Google Ads data — campaigns, spend, ROAS, conversions. Same deduplication applied.
Shippo Sync	Pull real delivery status from Shippo AWB tracking. Show COD remittance amounts. Flag RTO orders.
AI Chatbot — Side Panel	A chatbot panel on the right side of every page. Shows both Claude AI and Manus AI. Merchant can ask anything about their data.
Manus AI (Meta Specialist)	Manus gives more accurate Meta data analysis. Claude learns from Manus outputs over time.
Claude AI (General Analyst)	Claude analyzes all platform data together — Meta + Google + Shopify + Shippo — and gives insights, recommendations, and report summaries.
Auto-Training Loop	Claude continuously trains on Manus outputs so over time Claude becomes as accurate as Manus for Meta data, without needing Manus every time.
Reports	Merchants can view and export performance reports. Data shown in tables and charts.

SECTION 03

Platform Architecture

The platform is structured in 5 layers — Data Sources, Backend Engine, Database, Frontend UI, and AI Layer. Each layer is independent and communicates through APIs.

Layer 1: Data Sources

Shopify Admin API + Webhooks, Meta Conversions API, Google Ads API + GA4, Shiprocket Orders API + AWB Tracking + COD Remittance API, Manus AI Agent.

Layer 2: Backend Engine

Node.js API Gateway handles all incoming requests and routes them. FastAPI (Python) handles AI inference. BullMQ job queue syncs all external data every 15 minutes. OAuth 2.0 for Shopify merchant authentication.

Layer 3: Database

PostgreSQL stores all order, attribution, and CAC data. Redis caches live dashboard data for fast page loads. Pinecone / pgvector stores AI embeddings and chat history for the Claude chatbot memory.

Layer 4: Frontend UI

Next.js 14 with Tailwind CSS. UI designed to be pixel-identical to Shopify — same sidebar layout, same table style, same green-white color scheme, same font size.

Layer 5: AI Layer

Claude API as the main chatbot and analytics engine. Manus AI as Meta specialist. Fine-tuning pipeline: Claude automatically learns from Manus outputs and improves over time. Both AIs share the same side panel in the UI.

Tech Stack Summary

Area	Technology	Purpose
Frontend	Next.js 14 + Tailwind CSS	Shopify-style UI, SSR, fast page loads
Backend	Node.js + FastAPI	API gateway + AI inference engine
Database	PostgreSQL (Supabase)	All structured order and ad data
Cache	Redis	Live dashboard data, sessions

AI Vector DB	Pinecone / pgvector	Chat history, Claude memory, embeddings
Job Queue	BullMQ	Background data sync every 15 min
Auth	Shopify OAuth 2.0	Merchant login and store connection
Deployment	Railway / Render	Backend hosting, auto-deploy from Git
AI	Claude API + Manus API	Chatbot, analysis, auto-training loop

SECTION 04

User Journey & Workflow

This section describes the complete journey a merchant takes — from first visiting the platform to using the AI chatbot for daily decisions.

Step 1	Merchant visits the Nexus login page	A clean, minimal login page with a single CTA — "Connect Your Shopify Store". Merchant clicks and is taken through Shopify OAuth. No username/password required.
Step 2	Shopify OAuth Connection	Merchant authorizes Nexus to access their Shopify store data. This is a one-time step. Nexus securely stores the access token and begins the first data sync.
Step 3	First Data Sync (Background)	While the merchant sees the dashboard for the first time, Nexus simultaneously pulls all historical orders from Shopify, connects to Shiprocket for delivery status, pulls Meta and Google Ads data, and runs deduplication on attribution.
Step 4	Dashboard — Overview	Merchant lands on the main dashboard showing top-level KPIs — Total Orders, True Delivered %, Blended ROAS, Average CAC, COD Pending Amount, RTO Count. All numbers update every 15 minutes automatically.
Step 5	Sidebar Navigation — Explore Data	From the left sidebar, merchant navigates to: Google Ads page (campaigns, spend, ROAS), Meta Ads page (campaigns, deduped conversions, ROAS), Shopify Data page (full orders table with all custom columns). Each page looks like Shopify natively.

Step
6

AI Chatbot — Ask Anything

On any page, the right-side chatbot panel is always visible. Merchant types a question like "Which Meta campaign gave the best ROAS last week?" — Claude responds using the actual synced data. Manus handles Meta-specific deep queries. Both responses appear in the same panel.

Step
7

Reports

Merchant goes to Reports page to see weekly/monthly performance summaries. Charts for ROAS trend, CAC trend, COD recovery rate, RTO rate. Option to export.

SECTION 05

Core Modules Breakdown

The platform is divided into 6 core modules. Each module is independent, can be built and tested separately, and connects to the central data engine.

Module 1: Authentication & Onboarding

- Login page with Shopify OAuth connect button
- Secure token storage for each merchant
- Automatic first-time data sync on successful login
- Multi-merchant support — each merchant sees only their own data

Module 2: Shopify Data Sync

- Pull all orders via Shopify Admin API
- Listen to Shopify webhooks for real-time order updates
- Store order_id, customer, total, payment status, fulfillment status
- Add custom columns: Acquisition Channel, CAC, Delivery Status, COD Remitted

Module 3: Attribution Engine

- Connect Meta Conversions API — match Meta events to Shopify order IDs
- Connect Google Ads Conversion API + GA4 Client ID matching
- Apply Last Non-Direct Click model to resolve conflicts
- Flag deduplicated orders visibly in the table (e.g. "Meta — dedup: Google also claimed")
- Calculate per-order CAC = ad spend attributed / orders attributed

Module 4: COD + Delivery Sync

- Connect Shiprocket Orders API — pull AWB numbers for all COD orders
- Use AWB Tracking webhook to get real delivery status (not just dispatch)
- Pull COD Remittance Report API — show actual cash collected vs pending
- Flag RTO (Return to Origin) orders in the orders table
- Show three new columns: Delivery Status, Return Status, COD Remitted

Module 5: Dashboard & Reports

- Top KPI cards: Total Orders, True Delivered %, Blended ROAS, Avg CAC, COD Pending
- Google Ads page: campaign table with spend, clicks, ROAS, conversions
- Meta Ads page: campaign table with deduplicated conversion data
- Shopify Data page: full orders table with all 4 custom columns
- Reports page: trend charts, weekly/monthly summaries, export option

Module 6: AI Chatbot Panel

- Right-side panel visible on all pages
- Claude AI: analyzes all platform data, answers any merchant question
- Manus AI: handles Meta-specific queries with higher accuracy
- Both AIs visible in same panel — Claude above, Manus below (or tabbed)
- Chat history stored per merchant using vector embeddings
- Claude auto-trains on Manus outputs via background fine-tuning pipeline

SECTION 06

AI Integration — Claude + Manus

The AI layer is the most unique part of this platform. Two AI systems work together — Claude as the general analyst and Manus as the Meta specialist — with a training loop that makes Claude smarter over time automatically.

Claude AI — Primary Chatbot & Analyst

Role	General marketing intelligence assistant for the merchant
Data Access	Full access to all synced data — Shopify orders, Meta Ads, Google Ads, Shiprocket
What It Does	Answers merchant questions, generates insights, summarizes reports, flags anomalies
Example Queries	"Which ad set had the lowest CAC this month?" / "How many COD orders are still pending?" / "Should I increase Meta budget?"
Training	Continuously trained on Manus outputs to improve Meta data accuracy over time
Memory	Chat history stored via vector embeddings — Claude remembers past conversations per merchant

Manus AI — Meta Data Specialist

Role	Specialist AI agent for Meta Ads data — more accurate than general models
Data Access	Meta Conversions API, Facebook Ads Manager data, campaign-level performance
What It Does	Deep Meta campaign analysis, audience insights, creative performance breakdown
Why Manus	Manus AI is specifically trained on Meta's data structures and gives more reliable attribution numbers
Integration	Manus outputs are fed into Claude's training pipeline — Claude learns Meta patterns from Manus

Auto-Training Loop — How Claude Gets Smarter

1. Merchant asks a Meta question	Both Claude and Manus respond independently
2. Manus gives the accurate answer	Manus's response is tagged as "ground truth" for Meta data
3. Difference is logged	If Claude's answer differs from Manus, the delta is recorded
4. Fine-tuning pipeline runs	Every week, Claude is fine-tuned using Manus-validated Q&A pairs

5. Claude improves	Over time, Claude matches Manus accuracy for Meta queries — reducing A
--------------------	--
